

Week-1 Lab Report

Objective:-

To learn basic C programming using input, output, Operators and Conditional Statements.

Apparatus:-

Laptop, Adapter, us code (or any compiler), Gcc compiler.

Experiments covered:-

- * Even or odd number
- * positive, Negative number or zero
- * Character checking
- * Leap year
- * memory size of data types
- * menu-based arithmetic operators
- * Largest of three numbers using Ternary operator
- * Swap without temporary variable
- * Swap using temporary variable
- * perfect square
- * Student grade
- * menu program with error handling
- * Grade point to letter grade.

Procedure:-

1. Open the C-compiler.
2. Write the required C-program
3. Compile the program and correct any mistakes
4. Execute the program.
5. Observe and verify that output.
6. Save the Source code for submission.

Theory:-

- * Conditional Statements such as if and ifelse used to make decisions.
- * operators such as +, -, >, < are used perform operations on data.
- * These Concepts help in solving mathematical programs

Sample program description:-

- Even or odd
- User enters one Integer number and these numbers are stored in variable n.

Logic used :

- checks whether the number is divisible by 2.
- modulus operator % is used.

Control flow :

- If $n \% 2 == 0$ prints even , otherwise prints odd.

Output :

- ⇒ it displays whether the number is even or odd

Observations :-

All programs were compiled and executed successfully without any errors.

The output methods matched the expected Results.

Conclusion :-

This laboratory exercise helped me understand loops, conditional statements and nested statements operators in C-programming language.

We learned the basics of C-programming and successfully executed using conditional statements

The week-1 C programming laboratory programs were implemented, tested, and verified successfully.
